

CHARGING AS A SERVICE

EVERYTHING YOU NEED TO KNOW ABOUT CHARGING SERVICES

Plugit Charging as a Service (CaaS) is a solution that makes it easier for businesses, professional transport operators and property owners to obtain a charging solution and transition to e-transport.. This guide contains everything you need to know about the topic.

FAST LANE ON THE ROAD TO REDUCE THE CARBON FOOTPRINT

Companies in different industries are taking the goals to reduce carbon dioxide emissions seriously. More and more companies these days see the sustainability perspective as a strategic choice. Some have set strict goals for their operations and may require reporting from their partners and their network of subcontractors as well. Plugit Charging as a Service (CaaS) provides an easy solution for charging an electric fleet and for monitoring and reporting charging sessions.

Reducing carbon dioxide emissions by transitioning to electric transport not only benefits the environment, but is also a profitable business strategy. An electric fleet gives you above all a competitive edge.

FAST, RISK-FREE CHARGING SOLUTION

Charging as a Service provides an alternative to investment and an effective way to anticipate the costs of charging. The aim of the CaaS solution is to expedite the transition to e-transport by eliminating uncertainties and investment needs.

With this solution, Plugit takes responsibility for delivering the charging infrastructure and the company can utilize the charging solution on a pay-by-use basis without having to invest substantial capital in the project.

ALL FEATURES AND SERVICES FOR A MONTHLY FEE

The company pays for charging based on, for example, the number of charging stations, charging time or charged energy.

- Plugit supplies the infrastructure and owns the equipment
= No investments
- Monthly fee = No unexpected costs
- Scalable service = Always flexibly adapted to your needs

The solution includes everything from planning to ongoing maintenance and servicing, including the software, charging equipment and the necessary mobile applications e.g. for professional drivers.

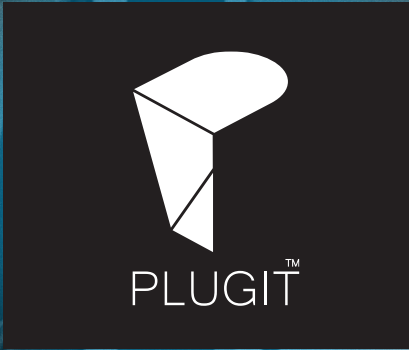

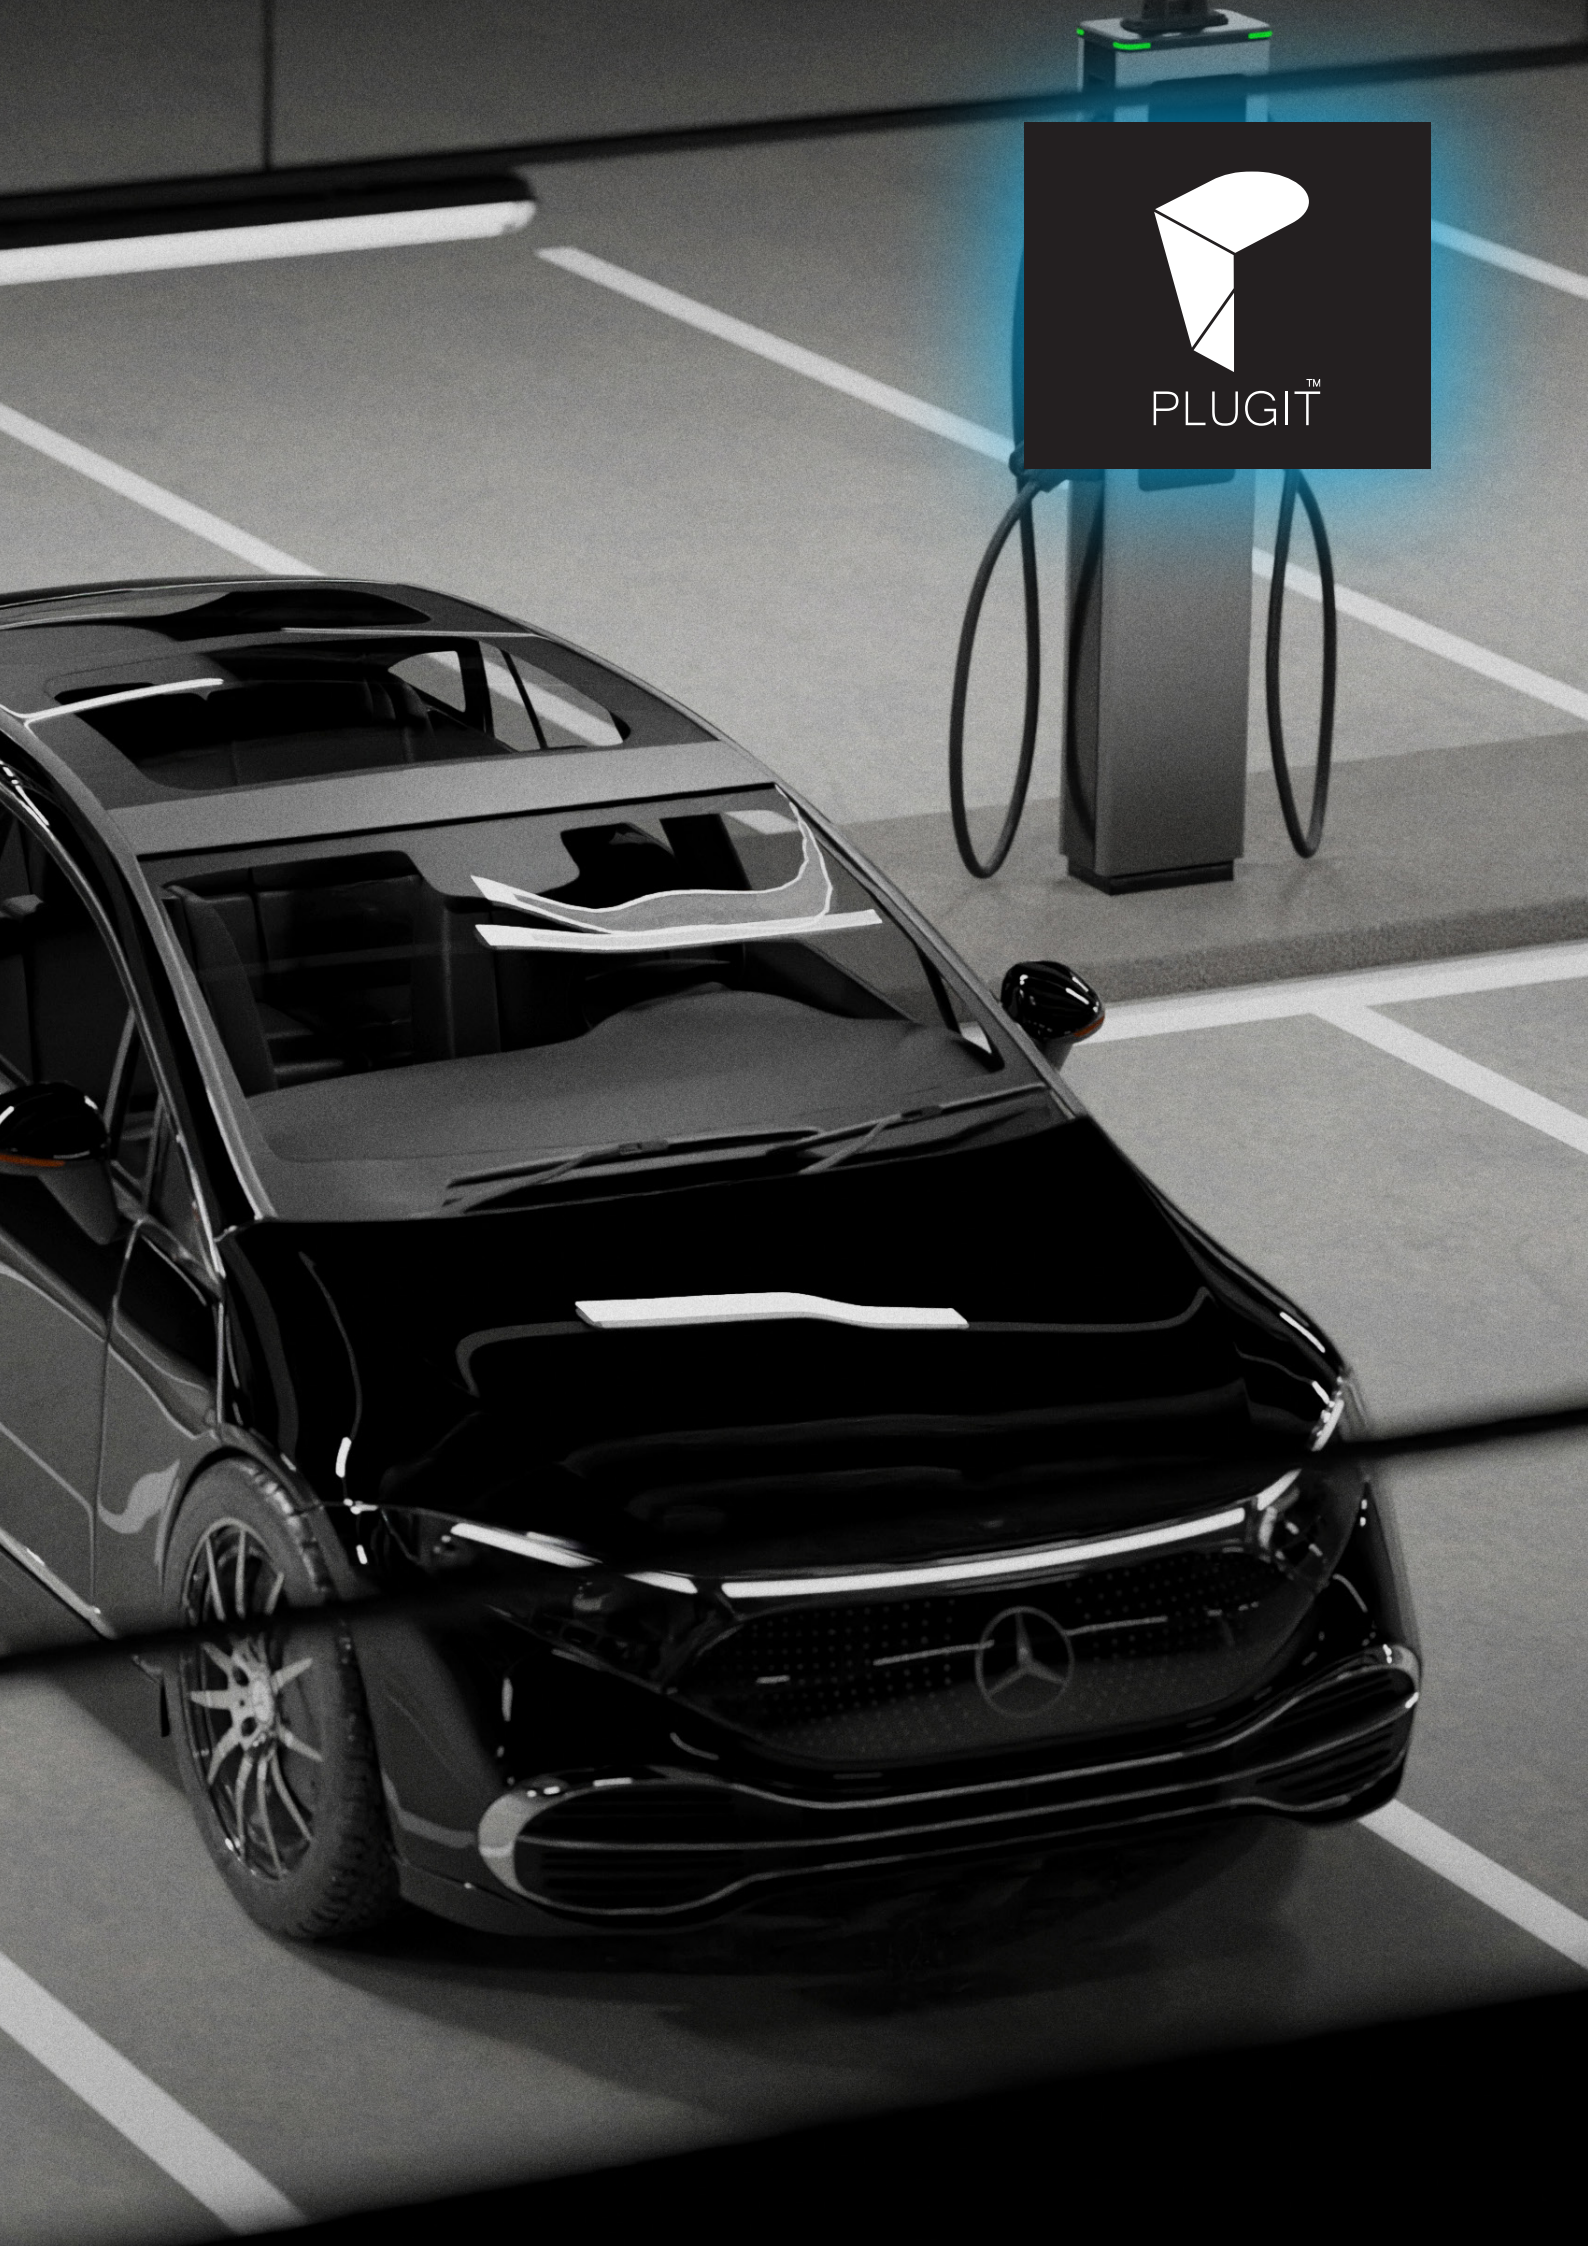

CAAS FOR PROPERTIES

EV charging at properties, such as shopping centres, business premises and car parks, is no longer just a convenient extra service, but a necessity for EV drivers.

EV consumers choose to do their shopping in properties that offer all the products and services they need, including EV charging. A charging point is an essential requirement that is part of the standard equipment of a property, not simply added value.

The CaaS solution does not require initial investment in charging infrastructure, so obtaining your first charging stations is risk-free. Increasing the number and capacity of the stations is also easy as the customer volumes and utilization rates grow.

The property owner does not need to worry about having enough charging stations or ensuring successful charging sessions; that's our job.

CAAS FOR BUSINESSES

A single company can use charging solutions for multiple different purposes. Company vehicles, customers' vehicles and employees' vehicles can all be charged in the same premises.

The charging solution should serve all the user groups as a seamless system. The company's own fleet needs to stay on the move, but a successful charging session also has a positive effect on the customer experience. A charging option at work is a welcome benefit for many employees with an electric vehicle.

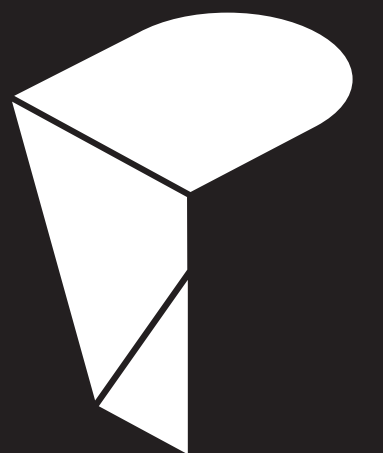

Our CaaS solution ensures that the company's charging solution is always up to speed. Stations and capacity can be increased as usage grows, and equipment can be restricted to specific user groups. The comprehensive, flexible solution adapts perfectly to your business needs.

CAAS FOR PROFESSIONAL TRANSPORT OPERATORS

EV charging is a key part of the business in the professional electric transport sector. Vehicles need to stay on the move as much as possible, so the most expensive charging solution simply does not work. In addition to reliability, charging solutions need to cater to the unique needs of professional transport and particularly heavy-duty vehicles that need high charging power.

In our CaaS solution, we design an EV fleet charging solution that perfectly supports the green roadmap and business. We combine cutting-edge equipment with smart software and your fleet to create a seamless system, available for a monthly fee without high initial investment. As your EV fleet grows, the system can be easily scaled up to match the larger fleet.

Our customer does not have to be an expert in charging, but they can focus on their core business. We will keep the fleet moving and the charging system up to speed.
